Abstract Of 8992 tagged Australian salmon (*Arripis trutta esper*) liberated in Western Australia between 1945 and 1976, 2283 have been recaptured to date (February 1988). The date and place of release and, where known, the age and length at release are given. The recapture information includes, where known, tag type, locality, date, age and/or length, and whether the return was made by amateur or professional fishermen.

Introduction

During CSIRO investigations into the biology of Australian salmon, many tagged fish were released between 1945 and 1955 (experiments WA001 to WA059; 2487 releases and 506 recaptures), 1963 and 1967 (experiments WA060 to WA103; 6293 releases and 1718 recaptures), and 1975 and 1976 (experiments WA104 to WA117; 212 releases and 59 recaptures). The resulting information has not been fully analysed (see references). To make further analyses of the data possible, and to provide a historic record, the data are listed in a common format with the fullest information that could be extracted from CSIRO Division of Fisheries Research divisional records.

Data format

Fish length measurements are from the snout to the caudal fork. Lengths at release are accurate, as the fish were measured by scientific staff. Before experiment WA060, most recaptured fish were probably measured by amateur or professional fishermen, so some measurements are likely to be inaccurate. After experiment WA060, more of the recaptured fish were measured by scientific staff based at a local cannery, but unfortunately these measurements cannot be separated from those made elsewhere.

The length composition of fish released in each experiment is recorded in various ways as:-

- a) Numbers within modal length groups, the modes being determined by the inspection of length-frequency graphs constructed from measurements taken from all or some of the fish tagged.
- b) Percentages within modal length groups (in square brackets) determined from separate subsamples of fish not tagged.
- c) Estimated total length ranges (in parentheses) determined from separate subsamples of fish not tagged.

For some experiments no length information was recorded at release.

From experiment WA104, onwards, the age composition of released fish is given. This was determined by reading scale samples, usually taken from every fifth fish tagged and applying the resulting age information to length-frequency modes.

Up to experiment WA059, a variety of tag types were used. Where more than one type was used in an individual experiment, returns for each type are noted. Full details of the various types of tags used are listed in Thomson (1963) and Stanley (1983).

From experiment WA051, no tag types are listed as only the internal tag with an attached streamer was used. (Internal tags used in earlier experiments did not have a streamer.)

All release and recapture localities are plotted in Figure 1. Experiment numbers relating to individual release localities are listed in Table 1.

Table 1. Index of release localities

Column symbols

*	in "date of recapture" column: date is approximate
+	in "date of recapture" column: date when the tag was returned, actual capture date is usually one to five days earlier
#	in "age at release" or "age at recapture" column: fish were aged directly from scale samples
+	in "age at release" column: age at release was estimated from a separate subsample of fish
A,P	in "returned by" column: tag was returned by an amateur or professional fisherman
In, Op, Pe	in "recapture number column of Experiments WA 032 - 049: In = internal tag; Op = operculum tag; Pe = Petersen tag
